0.1	Probability Measures . . . . .	2
-----	--------------------------------	---

## 0.1 Probability Measures

Let  $\Omega$  be a non-empty set. (Think of it as a sample space = set of all possible outcomes of an experiment involving randomness.) Ex: Flip a coin twice.

$$\Omega = \{HH, HT, TH, TT\}.$$

Let  $A \subset \Omega$ . Ex:  $A =$  an event,  $\{HT, TH, TT\}$ . With fair coin  $P_r(A) = \frac{3}{4}$

To measure a 2D blob: usual length, area, volume ..

We want to assign probability to subsets of  $\Omega$

$P : \text{subsets of } \Omega \rightarrow [0, 1]$ .

### Definition: Field

Let  $\Omega$  be a non-empty set. Let  $\mathcal{F}$  a collection of subsets of  $\Omega$ .  $\mathcal{F}$  is called a **field (or algebra)** if

1.  $\Omega \in \mathcal{F}$
2.  $A \in \mathcal{F} \Rightarrow A^c \in \mathcal{F}$  ("closed under complements")
3. Given  $A_1, A_2, \dots \in \mathcal{F} \Rightarrow \bigcup_{i=1}^n A_i \in \mathcal{F}$  ("closed under finite unions").

*Remark.* We can also use "closed under intersection" to define because of De Morgan's law.

$$\left( \bigcap_{i=1}^n A_i \right)^c = \bigcup_{i=1}^n A_i^c.$$

### Definition: $\sigma$ -field

If (iii) is replaced by a *countable* union, e.g.  $\bigcup_{n=1}^{\infty} A_n$ , then  $\mathcal{F}$  is called a  **$\sigma$ -field**.

*Remark.*  $\sigma$  field is stronger than field.

**Example** ( $\sigma$ -fields).

$\Omega$ .

- $\mathcal{F} = \{\emptyset, \Omega\}$
- $\mathcal{F} =$  the power sets (all possible subsets of  $\Omega$ ). (Billingsley: "power class").
- Take any  $A \subset \Omega$ . Define  $\mathcal{F} = \{\emptyset, A, A^c, \Omega\}$

A counterexample of a field that is not a  $\sigma$ -field. Let  $\Omega = \mathbb{R}$ ,  $\mathcal{F} =$  the empty set and all finite disjoint unions of things like  $(a, b]$  and/or  $(a, \infty)$  for  $-\infty \leq a < b < \infty$ .

(i)  $\Omega = (-\infty, \infty) \in \mathcal{F}$  (ii) Complements: Ex:  $(a, b]^c = (-\infty, a] \cup (b, \infty)$ . More

generally a set in  $\mathcal{F}$  has the form a bunch of disjointed  $(\ ]$  or  $(\infty)$ .  
(iii)

Case (1).  $A_1, A_2$  have no overlaps. Then  $A_1 \cup A_2$  is still a finite disjointed union.

Case 2: Some overlap, then  $A_1 \cup A_2$  is still the same type of interval.

However, it is not a  $\sigma$ -field. We want to find a countable collection of sets that isn't in here. Let  $A_n = (0, 1 - \frac{1}{n}]$ . Then  $\bigcup_{n=1}^{\infty} A_n = (0, 1) \notin \mathcal{F}$ .

### Definition: $\sigma(\mathcal{A})$

Let  $\mathcal{A}$  be a collection of subsets of  $\Omega$ . The  **$\sigma$ -field generated by  $\mathcal{A}$**  is the smallest  $\sigma$ -field containing all the sets in  $\mathcal{A}$ . We write it as  $\sigma(\mathcal{A})$ .

Note:

- If  $\mathcal{F}$  is a  $\sigma$ -field,  $\sigma(\mathcal{F}) = \mathcal{F}$ .
- If  $\mathcal{F}$  is a  $\sigma$ -field and  $\mathcal{A} \subset \mathcal{F}$ , then  $\mathcal{A} \subset \mathcal{F}$ .
- $\sigma(\mathcal{A}) = \bigcap \mathcal{F}$  the intersection over all  $\sigma$ -field that contain  $\mathcal{A}$ .
- $\mathcal{A} \subset \mathcal{A}' \Rightarrow \sigma(\mathcal{A}) \subset \sigma(\mathcal{A}')$

Example:

- $A \subset \Omega, \mathcal{A} = \{A\} \Rightarrow \sigma(\mathcal{A}) = \sigma(A) = \{\emptyset, A, A^c, \Omega\}$
- **Borel Sets** in  $\mathbb{R}$ . Let  $\Omega = \mathbb{R}$ ,  $\mathcal{A}$  = all open finite intervals in  $\mathbb{R}$ .  $\mathcal{B}(\mathbb{R}) = \sigma(\mathcal{A})$ . Note: include all half open intervals. It also contains single points:  $\{a\} = \bigcap_{n=1}^{\infty} (a, a + \frac{1}{n}]$ . Cantor sets are not in here.

### 0.1.1 Unions and Intersections of $\sigma$ -Fields

- The union of two  $\sigma$ -Fields is not a necessarily a  $\sigma$ -Field. Take  $A, B \subset \Omega, A \neq B, \sigma(A) = \{\emptyset, A, A^c, \Omega\}, \sigma(B) = \{\emptyset, B, B^c, \Omega\}$ . So  $\sigma(A) \cup \sigma(B)$
- The intersection of two  $\sigma$ -Fields is a  $\sigma$ -Field. Let  $\mathcal{F}_1, \mathcal{F}_2$  be two  $\sigma$ -Fields.  $\mathcal{F}_1 \cap \mathcal{F}_2$  (i)  $\Omega \in \mathcal{F}_1 \cap \mathcal{F}_2$  since  $\emptyset \in \mathcal{F}_1$  and  $\emptyset \in \mathcal{F}_2$ . (ii) Let  $A \in \mathcal{F}_1 \cap \mathcal{F}_2$   $A \in \bigcap_{n=1}^{\infty} \mathcal{F}_n \Rightarrow A \in \mathcal{F}_n \forall n \Rightarrow A^c \in \mathcal{F}_n \forall n \Rightarrow A^c \in \bigcap_{n=1}^{\infty} \mathcal{F}_n$
